NHS Frimley Park Hospital
Children’s Ward F1 Expansion

ITC completed essential works at the NHS Frimley Park Hospital. The project included an extension to the first floor along with the refurbishment of selected areas of the Paediatric and Teenage Unit of the hospital.

The project involved a full strip out of fixtures and fittings including the existing mechanical and electrical services to create a shell from which the team could work from.

Extensive M&E work was required, including the installation of mechanical and electrical equipment, installation of medical gases and piped supply system and modifications to the drainage.

The ITC team refurbished the wards by installing new partitions, suspended ceilings, doors, windows, and renewed floor and wall coverings. Fire protection works were also completed. This work took place on a live site; one where it was essential to keep any disruption to a minimum and uphold the highest levels of health, safety and hygiene, given the sensitive nature of working on and around a children’s ward.

The refurbishment created a highly efficient clinical setting that caters for patients and medical practitioners alike.
